M/s. National Centre for Quality Calibration

4, Abhishree Corporate Park, Nr. Swagat Bunglow BRTS,

Iskcon-Ambli Road, Ambli, Ahmedabad-380 058.

Customer's Ref. No.: Letter dated nil

NCQC

Valid up to 03

2. Description & identification of instrument

Type: Load Cell Capacity:10 kN

Digital Indicator Sr. No.: 14625

Manufacturer: Star Embedded Systems

SI, No. 14625 Connector Type: 5 Pin Model: LED-SD1 Resolution: 1 div Cable Length: 4.9 mir

Accessories: Self-aligning compression pads.

3. Environmental conditions:

Temperature: $(23 \pm 1)^{\circ}$ C

Relative humidity: $(50 \pm 10) \%$

4. Standards used Associated uncertainty 50kN Dead Weight Force Machine

 $\pm 0.007\% (k=2)$

NCOC System Certificate No.24

5. Traceability of standard used:

The standard(s) used for calibration is (are) traceable to the National Standard, which realize the units of quantities according to the International System of Units (SI).

6. Principle/Methodology of calibration and Calibration procedure No.:

Sub-Div.#D1.05/Doc.#3/CP#FT/F-02 broadly based on IS 4169-2014.

No load output: The digital indicator was switched on for 30 minutes to warm up and stabilized for no load output before the start of calibration. The no load output was noted (before taring) and the calibration signal was noted.

Before the application of the calibration forces, the instrument was preloaded thrice to its maximum capacity and kept at full load for about 90 seconds.

The sequence of the applied calibration force in compression is given below: At 0°: Two series of calibration forces in increasing values. At 120° and 240° positions: One series of calibration forces each in increasing values. Creep test is performed by calculating the difference in output i_m obtained at 30s and i_{sm} obtained at 300s after the removal of the maximum calibration force and express this difference as percentage of maximum deflection.

The calibration was made by using Self-aligning compression pads provided along with the instrument to ensure axial application of the force.

Between each series, the instrument was rotated along its axis so as to occupy during the calibration three positions (0°. 120°& 240°) and the instrument was subjected to the full load once for about 90 seconds each time before starting in a new position.

Between the loadings, readings corresponding to no load after waiting at least 30 seconds for the return to zero were noted.

Interpolation Equation: (Compression)

 $F = {}^{4} - 1.2437 \times 10^{-15} \cdot X^{3} + 4.2488 \times 10^{-16} \cdot X^{2} + 5.0106 \times 10^{-2} \cdot X + 0.6612$

 $X = 1.9674 \times 10^{-10}$, $F^3 - 3.3702 \times 10^{-6}$, $F^2 + 19.9575$, F - 13.1884

Where F - Force in N

X - Digital Indicator reading in Div

Classification: The force proving instrument is found to comply with the requirements of 1S: 4169-2014 in respect of interpolated forces and classified as follows:

Class	Mode	From	To	Uncertainty of Measurement
Class 0.5	Compression	10000 N	500 N	± 0.08%=

The reported uncertainty is at coverage factor k-2 which corresponds to a coverage probability of approximately 95% for a normal distribution, considering the relative deviation of different components such as zero, resolution, repeatability, reproducibility, interpolation, creep and combining with the uncertainty of the applied force.
